

Name: _____ Period: _____ Date: _____

KEY USE

Use the first incorrect line to choose the next support. Every student completes all four required items; the challenge is separate.

#	Answer and work	Instructional evidence
1	609. The zero holds the tens place because 3 tens cannot be divided into 4 whole groups. $609 \times 4 = 2,436$.	A zero at an intermediate place is different from stopping the algorithm.
2	79 R10. Check: $24 \times 79 + 10 = 1,906$.	Remainder 10 is valid because it is less than 24.
3	7 buses. $158 \div 24 = 6 \text{ R}14$; all students require one additional bus.	The context changes the reported answer from 6 R14 to 7 buses.
4	1,032. The original work omitted the zero in the hundreds place. $1,032 \times 4 = 4,128$.	Have students label quotient places before repairing arithmetic.

Challenge

800 R5. The tens and ones quotient places both require zero. Check: $25 \times 800 + 5 = 20,005$.
