

Name: _____ Period: _____ Date: _____

KEY USE

Use the first incorrect line to choose the next support. Every student completes all four required items; the challenge is separate.

#	Answer and work	Instructional evidence
1	$1,906 \div 24 = 79 \text{ R}10$. That means 79 full crates, 10 tiles remaining, and 80 crates needed to ship every tile. Check: $24 \times 79 + 10 = 1,906$.	The color is irrelevant. Students must distinguish full crates, remainder, and total containers needed.
2	$72.45 \div 3.5 = 724.5 \div 35 = 20.7 \text{ ft}$. Check: $20.7 \times 3.5 = 72.45$. A reasonable estimate is about 20 or 21 ft.	The border color is irrelevant. Preserve square-foot and foot units while connecting area to division.
3	The first equality is incorrect because only the dividend was multiplied by 10. Correct repair: $72.45 \div 3.5 = 724.5 \div 35 = 20.7$.	Equivalent quotients require the same scale factor for both numbers.
4	The calculation is correct: $1,026 \div 24 = 42 \text{ R}18$. The conclusion is incorrect; the remaining 18 cans require one more box, so 43 boxes are needed.	Separate calculation accuracy from the contextual conclusion.

Challenge

Answers vary. Example 1: complete 24-cookie trays gives 6 trays with 14 cookies remaining. Example 2: 24-seat vans for 158 students requires 7 vans. The calculation is the same; the question determines how the remainder is reported.
